

AI ASSISTED PROGRAMMING

LEARN TO BUILD WEBSITES & APPS WITH AI TOOLS, EASY WORDS,
SLOW STEPS.

THEORY

INTRODUCTION: READ THIS FIRST

This book is for people who want to learn how to build things with code, even if they have never done it before. You do not need big English. You do not need big school. You just need a laptop, time, small patience, and the will to learn.

In this book, we learn what AI coding means, the tools we can use, how to build websites, what is frontend, backend, database, deployment, domain and so on. We learn everything step by step, slowly. Just like a teacher sitting beside you.

We also learn a new word **VIBE CODER**, someone who codes in a calm way. No fear. No rush. They build with clean mind and happy heart.

When you finish this book:

1. You will know how websites work.
2. You will know how apps work.
3. You will know how to use AI tools.
4. You will know how to deploy real projects online.

This book teaches like a friend easy, slow, and clear.

CHAPTER 1: What is AI Coding?

AI coding means coding with help of a smart machine. AI is like a second brain that works with you.

Before, people had to write every line of code by themselves. If they made mistake, they must find it alone. If code failed, they got confused and stuck.

But now, AI coding makes life easier.

With AI coding you can:

- Ask AI to write code for you
- Ask AI to fix your code if it is wrong
- Ask AI to explain code like a teacher
- Ask AI to give you ideas
- Ask AI to make websites and apps faster

AI does not remove your brain AI supports it.

You and AI work together like two hands washing each other.

Example

You type:

"AI, help me create a login page with email and password." AI gives you full code. You copy it, paste it, and the page works.

Why AI Coding is Powerful

- You build faster
- You learn faster
- Mistakes reduce
- You think more about ideas, not stress
- Beginners can start without fear

AI coding is like having a professional developer beside you 24 hours, never tired, always ready.

CHAPTER 2: Who is a Vibe Coder?

A **Vibe Coder** is not just someone who codes.

A vibe coder is someone who codes calmly, patiently, with joy.

A vibe coder:

- Does not panic when code breaks
- Uses AI to solve problems instead of stressing
- Builds slowly and smartly
- Codes with peace, music, snacks, smile
- Enjoys the journey, not only the result

A vibe coder believes learning is step by step. They are not afraid to make mistakes, because mistakes teach.

They don't compare themselves with others. They just flow like water, gentle but strong.

When you finish this book, I want **you** to be a vibe coder.

CHAPTER 3: Types of AI Tools

LOCAL DEVELOPMENT TOOLS

These are like workshops inside your computer. You write code. AI helps. You test, build and deploy real projects.

Cursor

Cursor helps you write and edit code with AI inside the editor.

When you type something, AI finishes it for you.

If you ask questions, Cursor explains like a teacher. It can change many files at once fast.

Windsurf

Windsurf is fast like a race car.

It helps you run servers, preview sites, and debug code quickly.

Good for front-end and full-stack work.

Zed

Zed is a very fast editor.

It is light like wind it opens big projects smooth, no lag.

You can work with team and AI at the same time.

Trae (AI IDE Agent)

Trae lets you talk to AI like a partner.

You tell it your task, it breaks it into smaller tasks and helps you finish step by step.

GitHub Copilot

GitHub Copilot feels like a friend sitting beside you while coding.

It auto completes code. It writes functions for you. Good for beginners and experts.

Local tools are powerful because:

- You control everything
- You can build big projects
- You can fix errors deeply
- You can connect many tools
- Best for long-term growth

MODERN WEB AI TOOLS

These tools are for speed + testing ideas.

Lovable

You chat with AI, it builds full website layout.
Just type what you want. It creates UI and pages.

Example:

“I want an online shop for shoes.” Lovable starts building.

Bolt.new

Bolt is fast for building apps.

You can build → test → deploy inside one place.

V0

V0 creates full apps from one prompt.

It writes code, design, backend logic, all combined.

Web AI tools are good for:

- ✓ Quick projects
- ✓ Fast idea testing
- ✓ Beginners
- ✓ learning structure

If your idea becomes big later, move to local tools.

CHAPTER 4A: Roles of AI in Web Development

AI is like fuel in car, it makes things move fast.

1. Speed & Efficiency: Work that takes 3 days can take 3 hours with AI.

2. Lower the entry barrier: Even someone who knows zero coding can start.

3. Boost Creativity: No idea? AI gives 10 more.

4. Workflow integration: AI helps from design → coding → deployment. One tool, many jobs.

5. Reduce early mistakes: AI sees errors quicker than humans.

6. Learn while building: AI explains code like a tutorial.

7. Reuse and improve old work: AI refactors old code and cleans it.

8. Helps you document: AI writes documentation, README, comments.

AI is not replacement.....AI is acceleration.

CHAPTER 4B: Why We Use Local Tools for Building

Online tools are fast, but local tools are strong like iron.

If you want to build big apps, long-term websites, systems with many users, use local.

Reasons:

- You can customize everything
- Works for large scale projects
- Best for full-stack (front + back)
- Smooth debugging
- More power, more control
- Good for professional work

Local tools = future-proof building.

CHAPTER 5: Who is a Full-Stack Developer?

A full-stack developer is like a house builder who can work inside and outside.

They play two roles

Part	Meaning
Frontend	What users see and touch (buttons, text, UI)
Backend	The hidden engine (database, servers, logic)

A full-stack dev connects both parts like a bridge.

They make features work from start → end.

They build login, dashboard, product system, payment, chat, etc.

Full-stack developer is king level and AI makes reaching this level much easier.

CHAPTER 6: Website vs. Web App vs. Mobile App

WEBSITE:

People visit to read or look.

Example: news website, blog.

WEB APP:

Website operating in form of an app or App operating in form of website, People do things, create, update, save. Example: online banking, email, dashboards.

MOBILE APP:

Lives inside your phone. Must be installed. Example: TikTok, WhatsApp, Instagram.

Website = look.

Web app = interact.

Mobile app = live in phone.

CHAPTER 7: What Makes a Website?

A website is like a body.

BODY PART	WEBSITE PART
Bone	Structure (HTML)
Skin	Design (CSS)
Brain	Logic (JavaScript)

The main building blocks:

- **Pages** → full screens
- **Sections** → parts inside a page
- **Components** → small reusable blocks

Every website is a collection of components.

PAGE

CHAPTER 8: Website Design Styles

Design is how your site feels emotionally.

Types of design:

STYLE	FEELING
Modern Style	Smooth + new
Dark & Dark mode	Cool + calm & Soft + bright
Glass UI	Frosted + shiny
Retro Vintage	Old-school vibe
Futuristic	Tech, neon, sci-fi
Minimalist	Clean + simple

Choose a style based on who will use your site.

CHAPTER 10: Frontend vs. Backend

Frontend = what you see.

Backend = what happens behind.

Frontend handles:

- Buttons
- Forms
- Text
- Colors
- Animation

Backend handles:

- Login
- Data storage
- Payments
- User accounts
- Messages

Frontend = presentation.

Backend = engine.

Together they make full app.

CHAPTER 11: Database, Auth, CRUD & Deployment

1. **Database:** Like a cupboard storing information.
2. **Authentication:** Allows user to sign-in securely.
3. **Profile Management:** Edit username, photo, bio.
4. **User Management:** Admin controls all accounts.
5. **CRUD =** Create, Retrieve, Update, Delete: Every app needs CRUD. No CRUD → no user life.
6. **Deployment:** Putting project online so anyone can access.

CHAPTER 12: Tools For Backend

These tools help you add backend without building from zero.

TOOLS	STRENGTH
Supabase	SQL power, realtime, storage
Firebase	Google scale, auth + cloud functions
Appwrite	Self-host control
PocketBase	Tiny, perfect for quick apps

They save time, energy, stress.

CHAPTER 13: Deployment, GitHub, Vercel

Why deploy?

So the world can use your app.

GitHub

Place to store code in folders called **repositories**. You can go back to older versions anytime.

Vercel

Takes your code → builds → gives live link. One click deployment.

Simple Flow

Write → Push to GitHub → Deploy to Vercel → Add Domain → Share with world.

CHAPTER 14: Domain & Hosting

Domain = your address (like home address).

Hosting = server house where files live.

Without hosting → domain useless.

Without domain → hosting invisible.

You need both to be online fully.

PRACTICAL

PART A: Web App & Website

Intro to Lovable/Modern Tools

1. What's Lovable and Lovable Interface
2. How to Create Project/Prompt Lovable (create one pager and multi-pager website and Web App).
3. How to connect Github
4. How to connect Supabase/lovable cloud
 - How to Edit Email Template
 - Redirect Url Configuration
 - How to ON/OFF Email Notification
5. How to Configure Authentications and How to get API keys
 - Google Auth
 - Email and Password
 - Discord Auth
 - Spotify Auth and more.
6. How to deploy to Vercel/Netlify
7. How to Create and Run project on Cursor (With Commands)
8. How to Import Existing Project from Github and Analyze it
9. How to Connect Backend with cursor
10. How to Deploy

PART TWO: Mobile App

1. How to Create and Run project on Cursor (With Commands)
2. How to Import Existing Project from Github and Analyze it
3. How to Connect Backend with cursor
4. How to Build APK File for the APP
